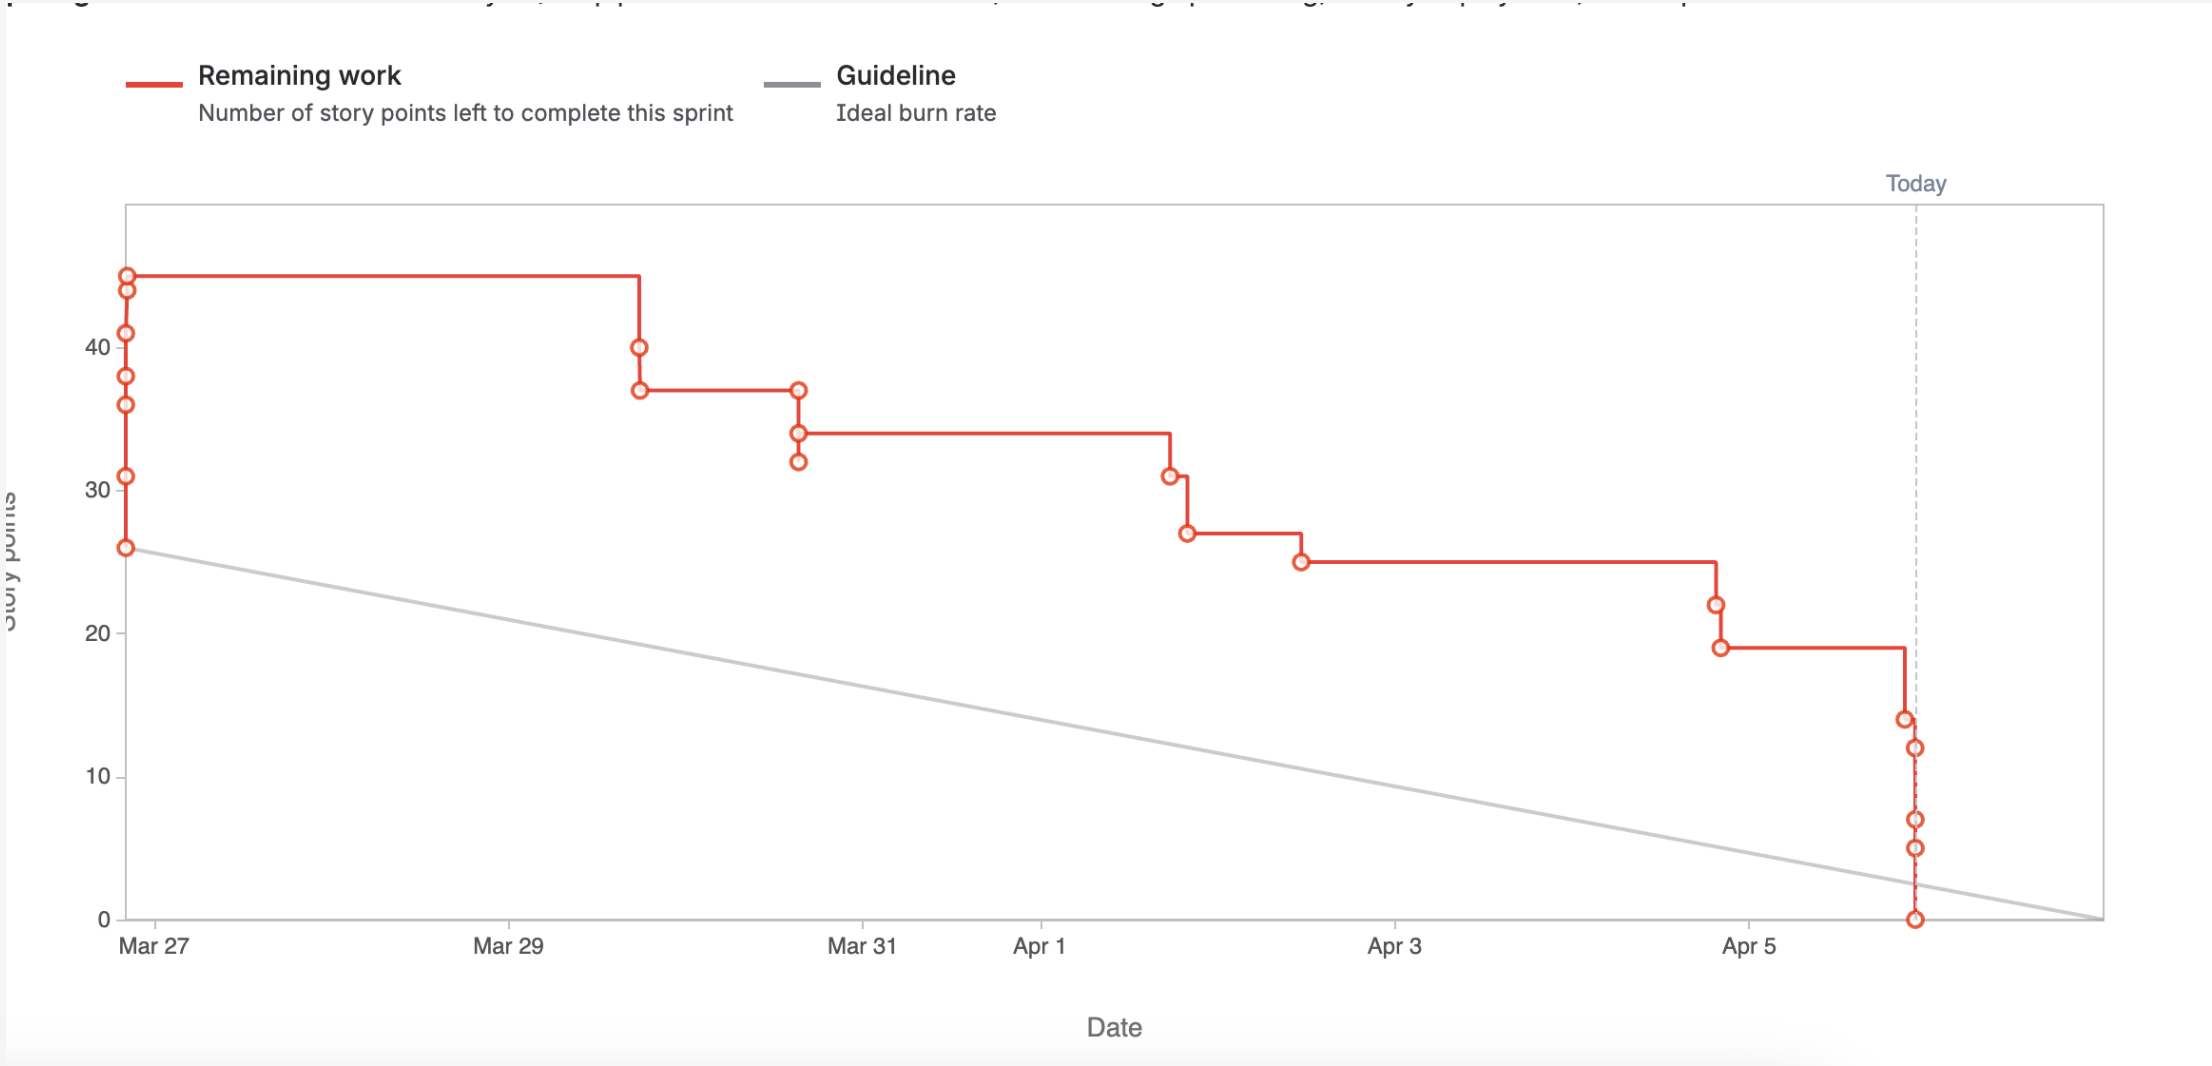
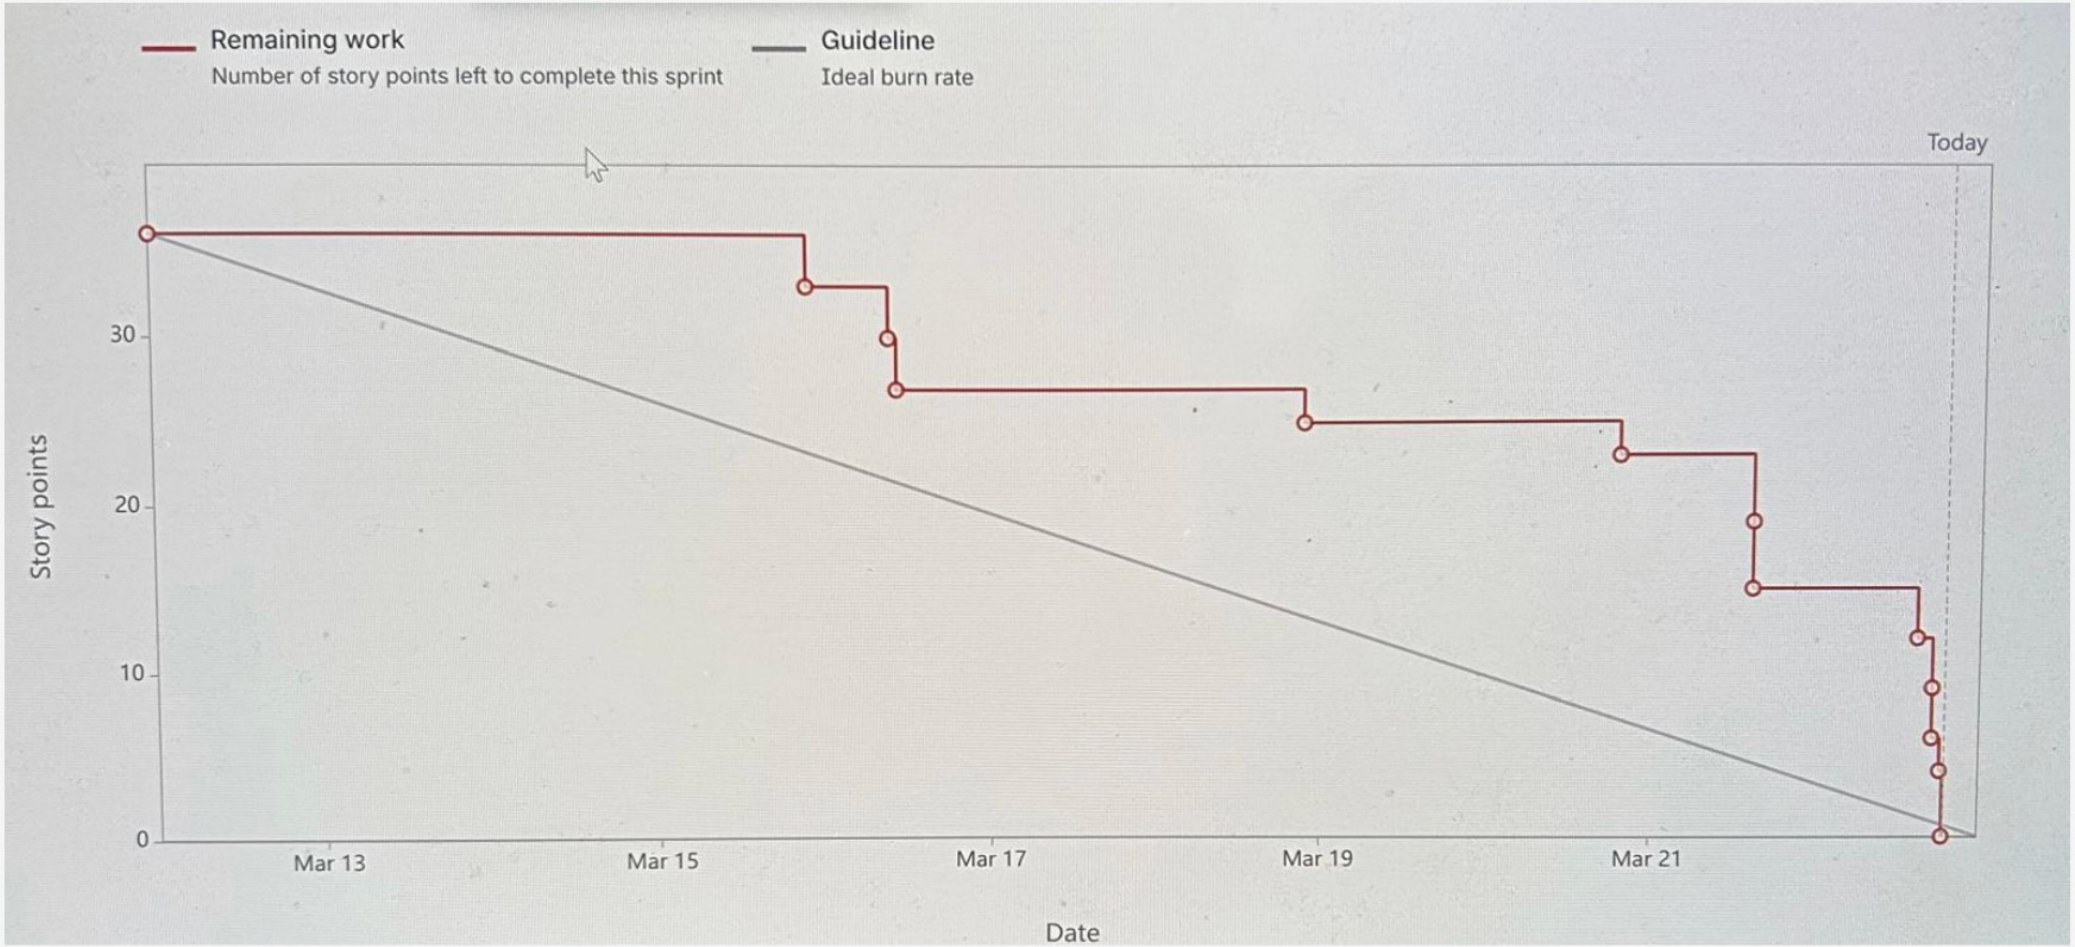
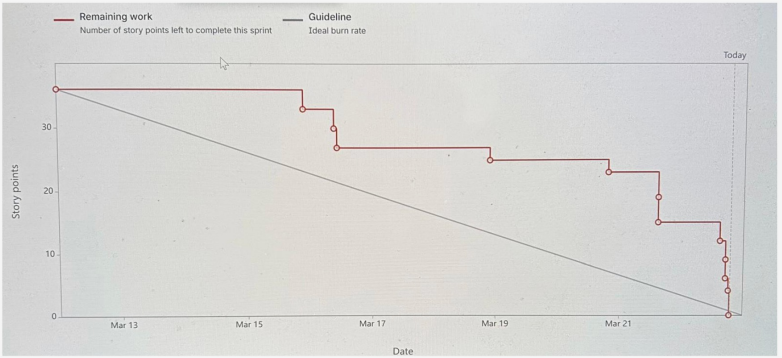
Burndown Chart – Sprint 4



Burndown Chart – Sprint 3



Burndown chart Analysis

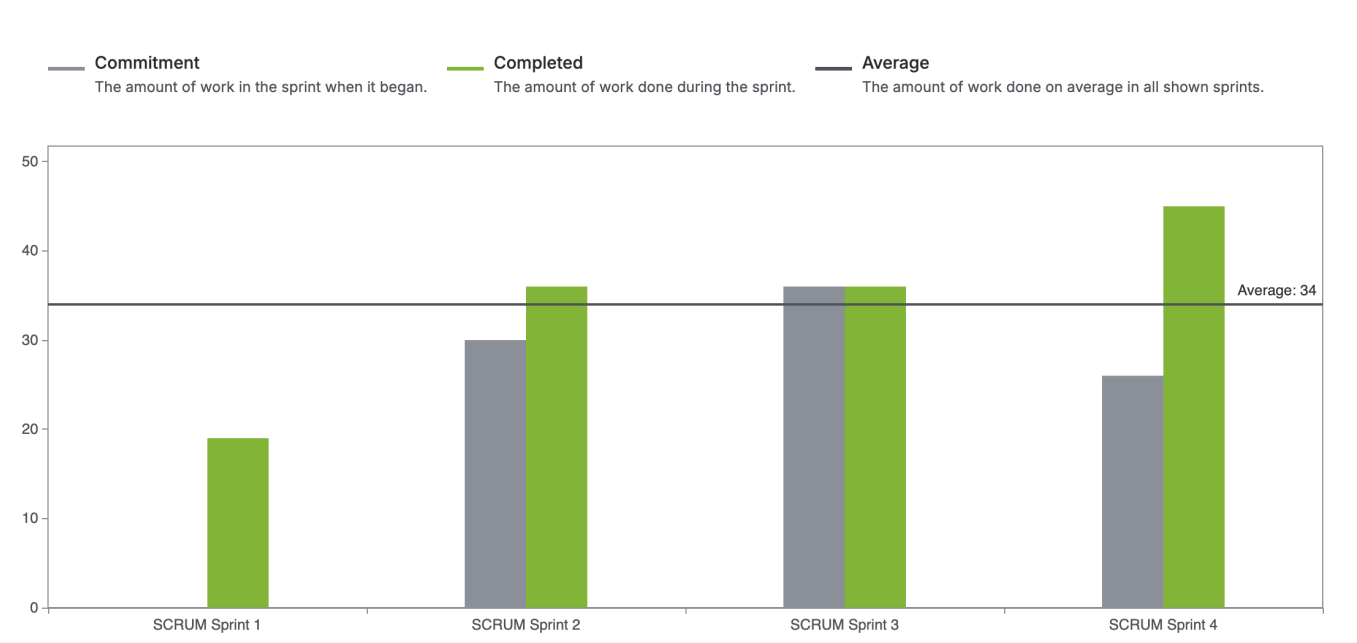


Sprint 4 progression is less consistent than Sprint 3. This can be seen from the progression lines on Sprint 3 that is closer to the linear pattern shown in dark gray. Sprint 3 had more steady of a decline, while Sprint 4 had more steep decreases

There is also evidence of increase in story points in the middle of sprint.

- For Sprint 4, we mistakenly marked an user story as done, and had to reverse, resulting in the spike in story points on March 30th

Sprint velocity vs. previous sprint



JIRA-exported Velocity Chart:

The higher number of completed tasks compared to the amount of committed tasks is explained due a delay of adding user stories after the start of the sprint. This still shows the team completed more work than average. This shows we should be committing to more work due to the rapid pace that the team completes tasks.
.

Changes and Why?

Story Points Adjustment

- We had higher story points for sprint 4 compared to sprint 3, because we anticipated that implementing the CI/CD Pipeline would be difficult and would require more time, so the increase in story points reflected that anticipated complexity, helping us better plan our capacity and avoid underestimating the work.

- The sudden increase in story points at the start of the sprint is because of a delay between the sprint starting and additional user stories being added
