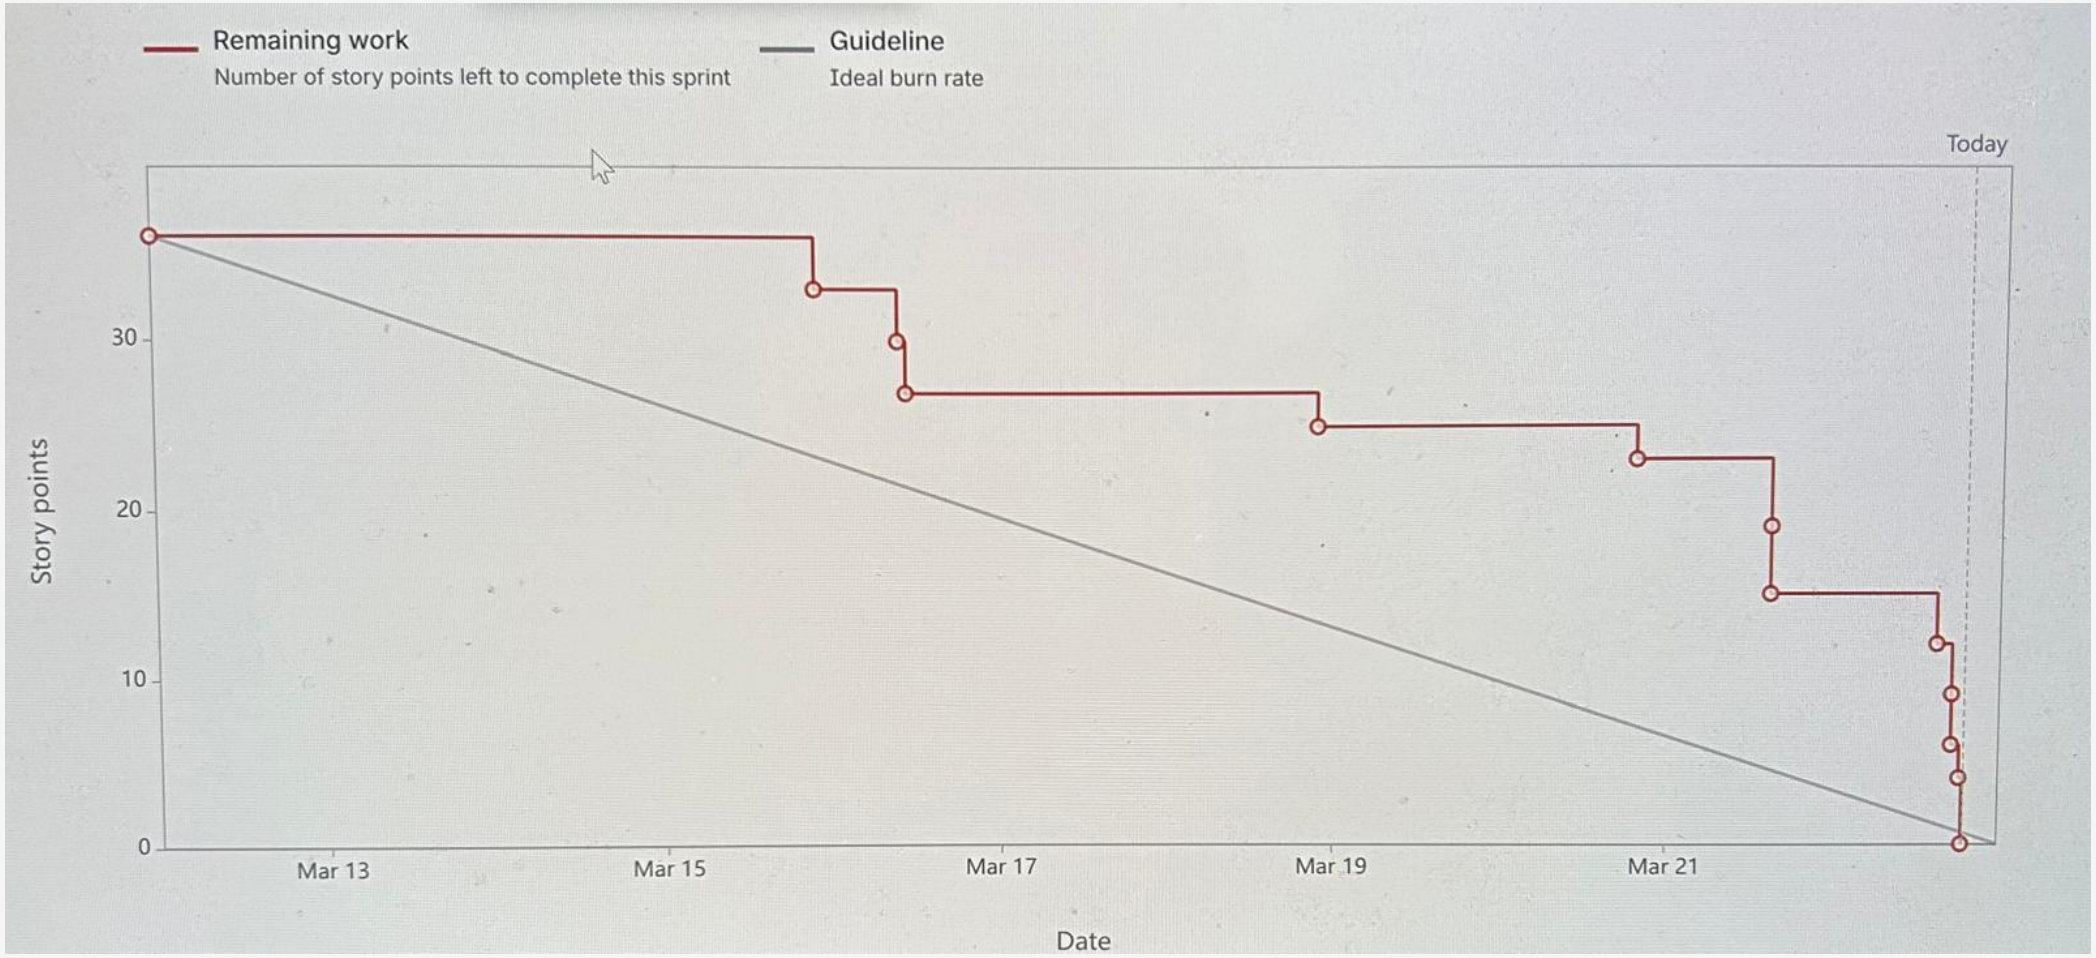
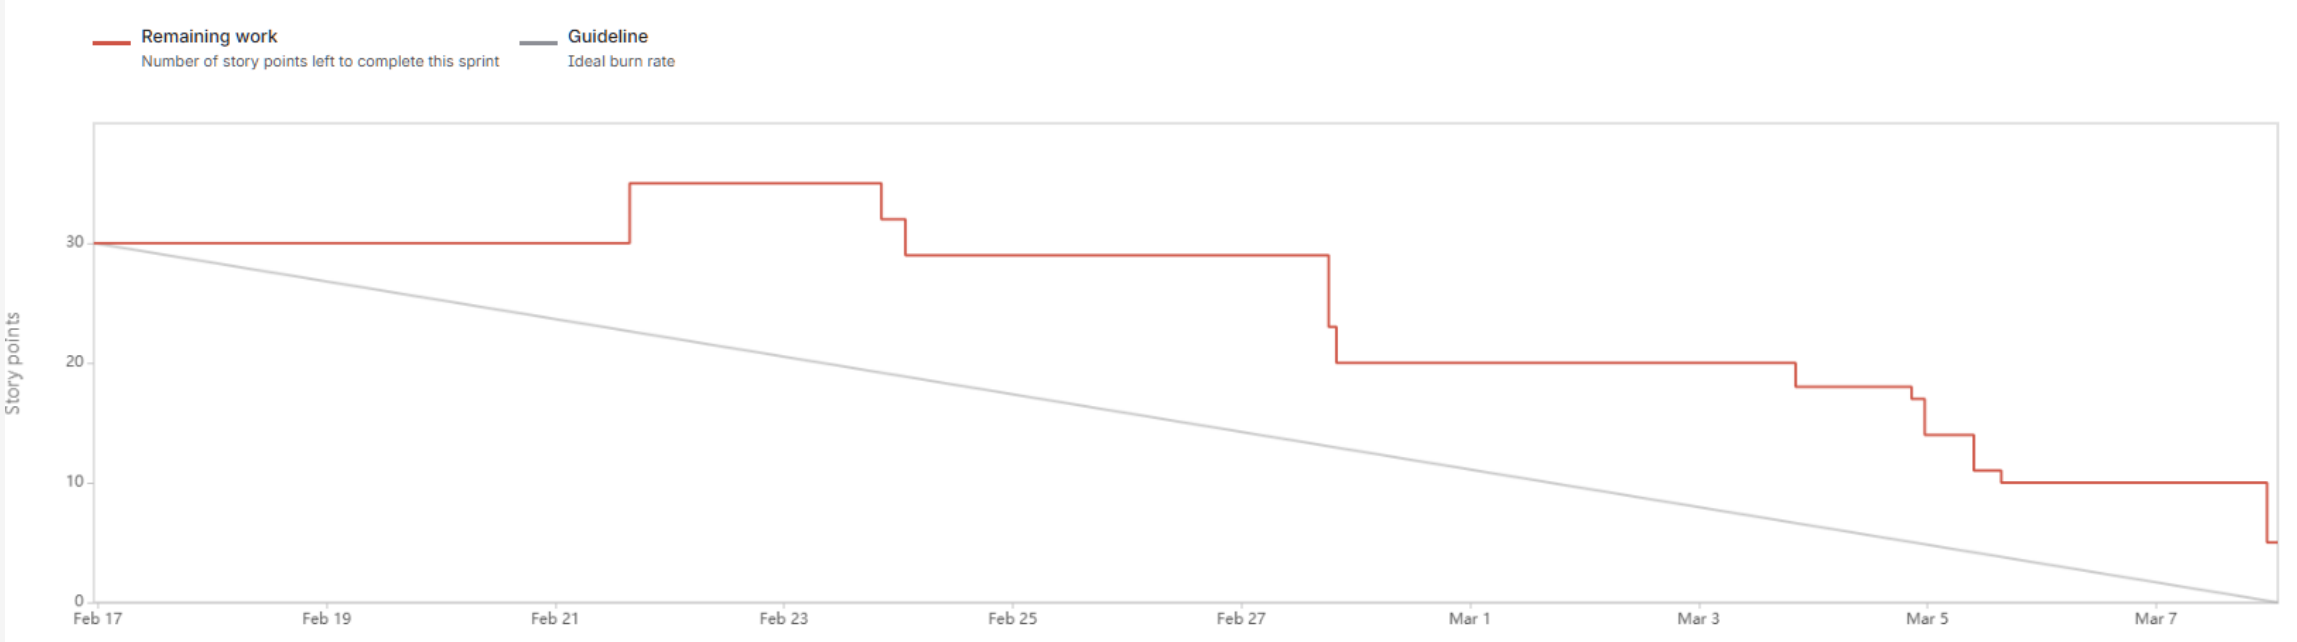
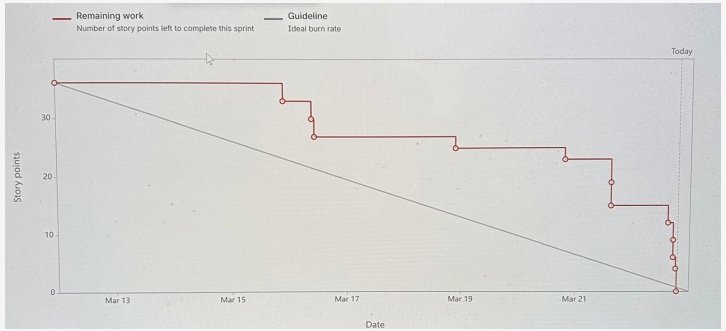
Burndown Chart – Sprint 3

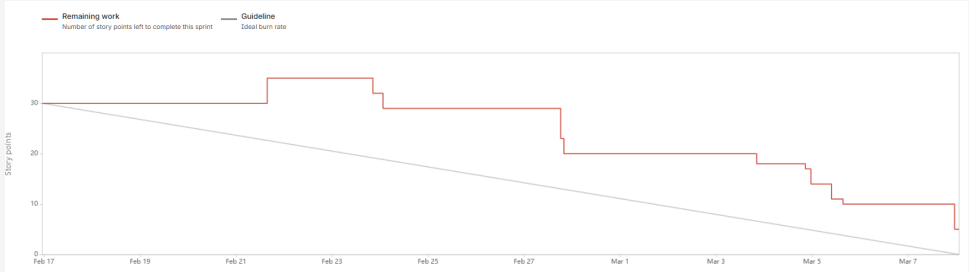


Burndown Chart – Sprint 2



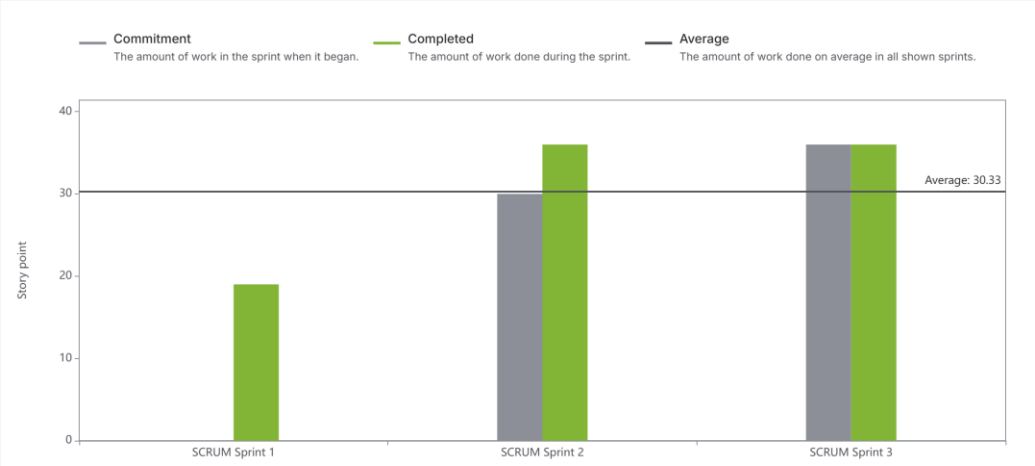
Burndown Chart Analysis





Sprint 3 is slightly more consistent than Sprint 2, as it's closer to the ideal burn rate (the gray linear line). We can also see that in Sprint 2, there is an increase in story points around February 21–23, caused by underestimation of some feature story points. Meanwhile, in Sprint 3, the orange line does not show any increase in story points because we didn't change any story points during the sprint.

Sprint velocity vs previous sprint



As we can see from the previous sprints (Sprint 1 and 2), the committed work shown is less than the actual commitment. The reason is that some user stories were not assigned story points, which caused an inaccurate commitment chart. We learned from the previous sprints and made sure every user stories is assigned with story points so that the chart accurately reflects the actual commitment. Also, the actual commitment for Sprint 2 and Sprint 3 should match the completed bar (like the one for sprint 3).

Changes and Why?

Story Points Adjustment

- There’s some increase of story point in earlier stage of sprint 2. On sprint 2 we still modify and make some changes to the story point of some user stories. The reason is some feature implementation difficulty is not as we expected so we made some changes to the user story during the sprint.

- Meanwhile in sprint 3 we don’t see any increase of story point. The reason is we have learned from past sprint to make sure we’re not overestimating and underestimating the story point of each user stories during our planning.
