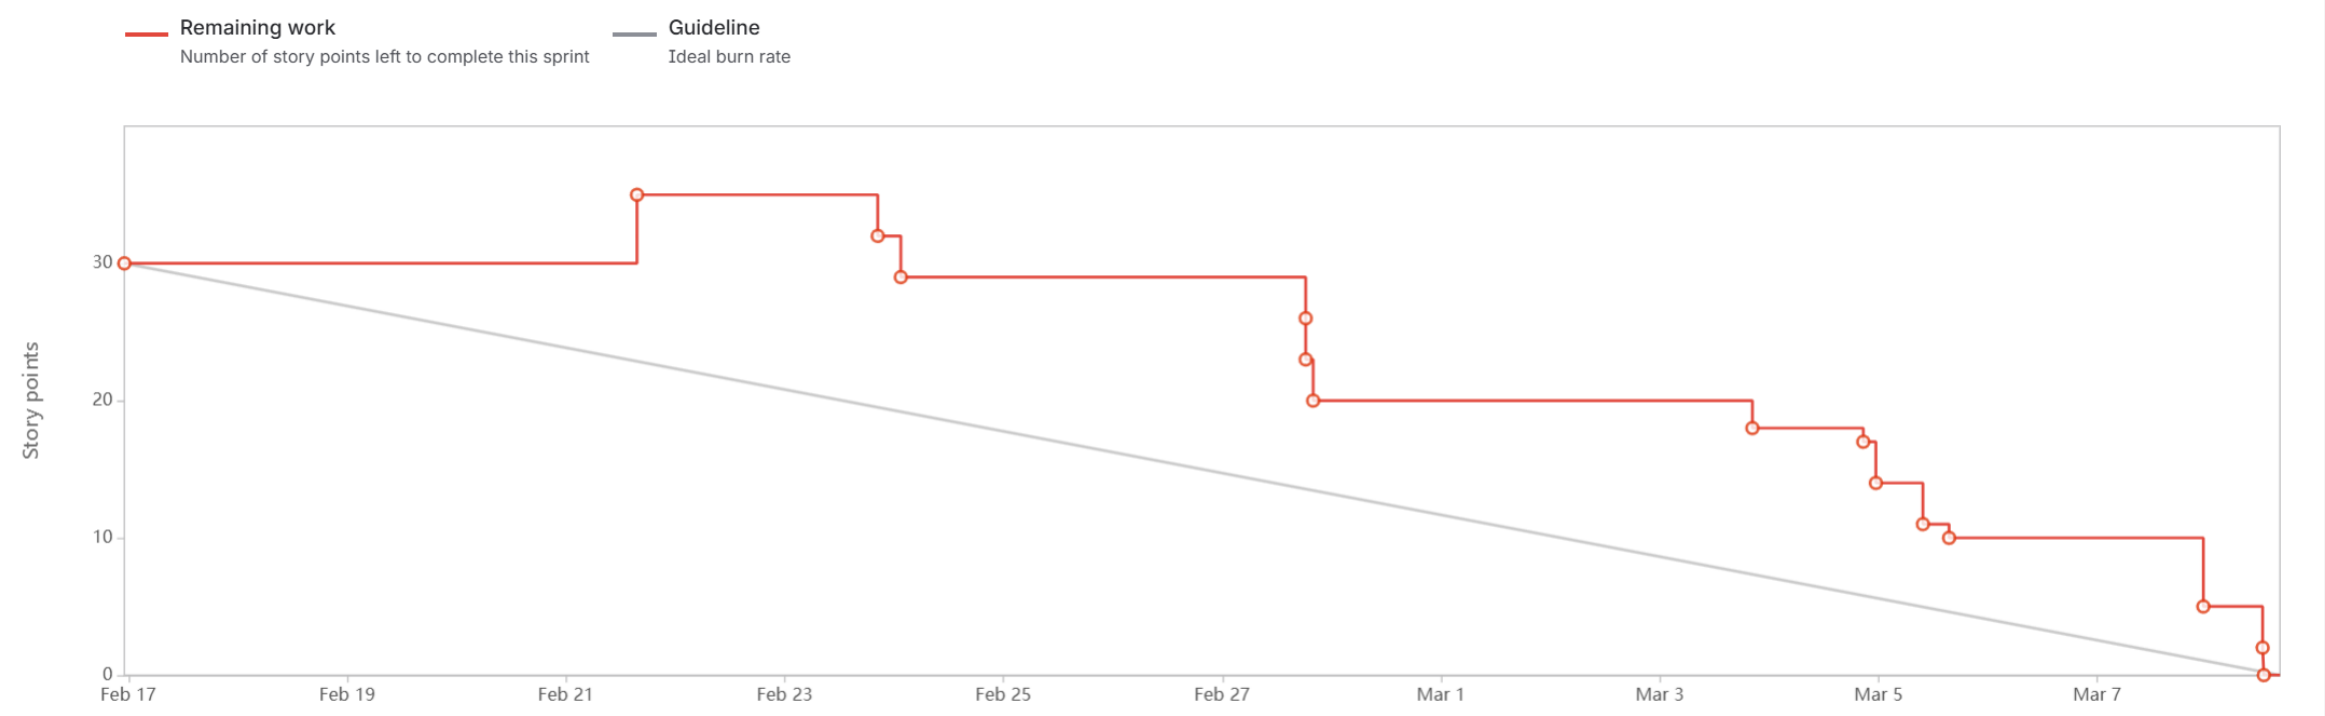
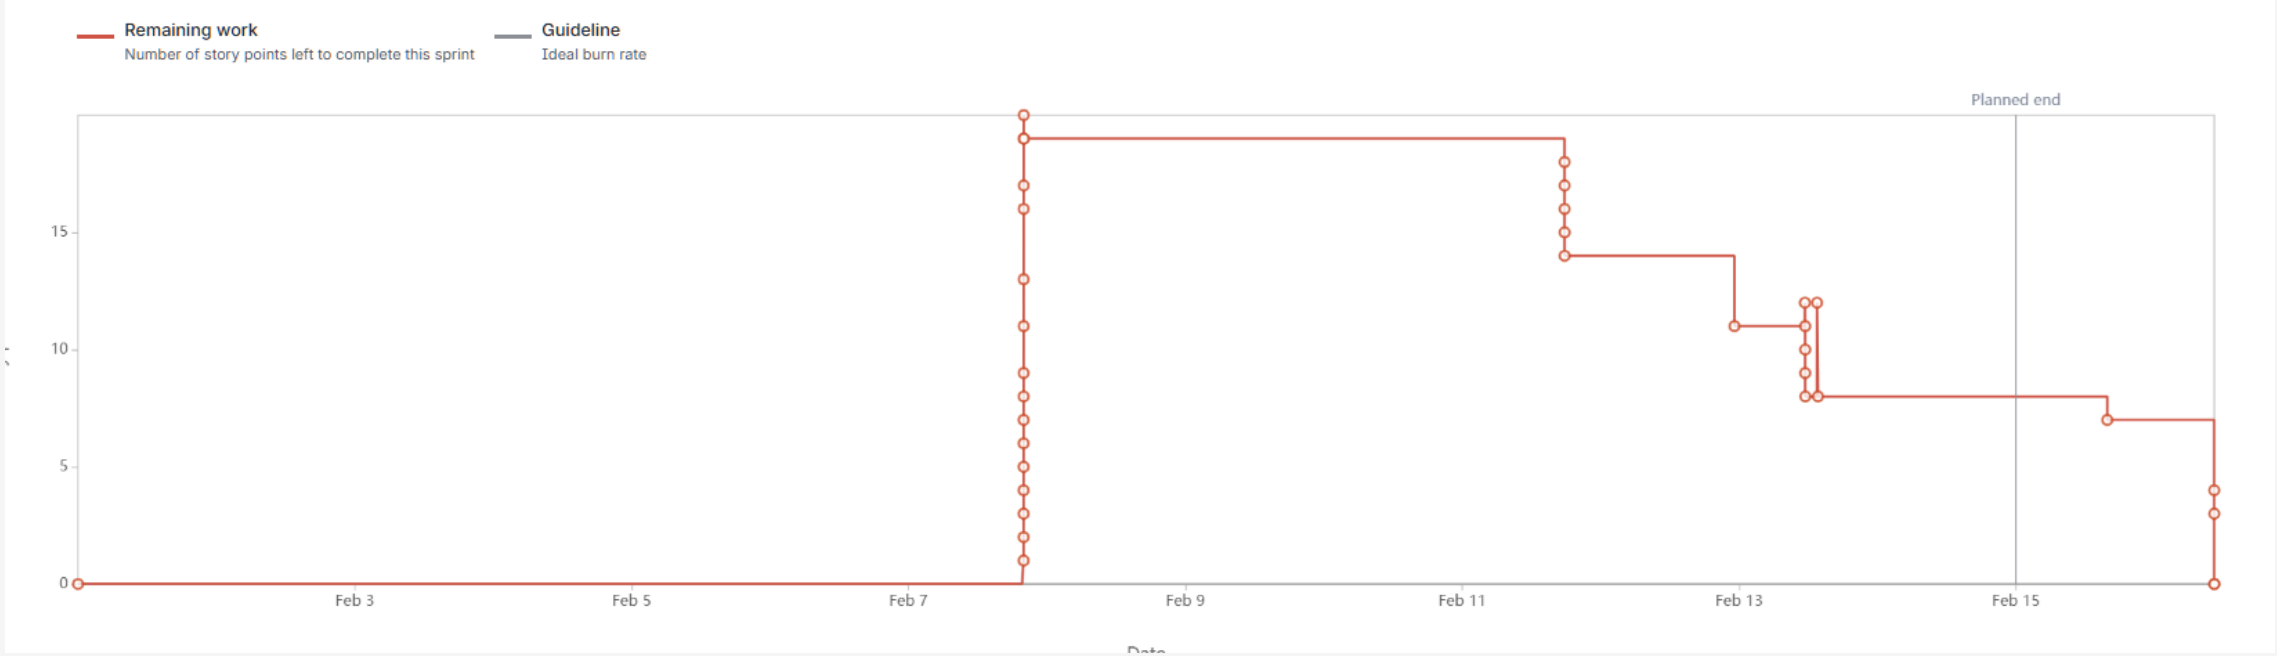
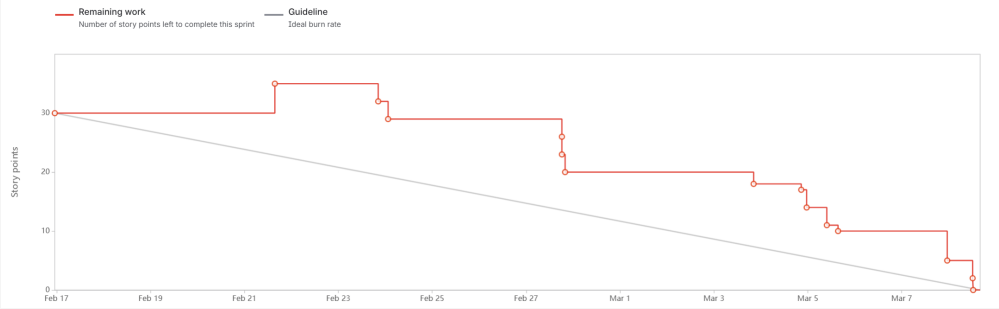
Burndown Chart – Sprint 2

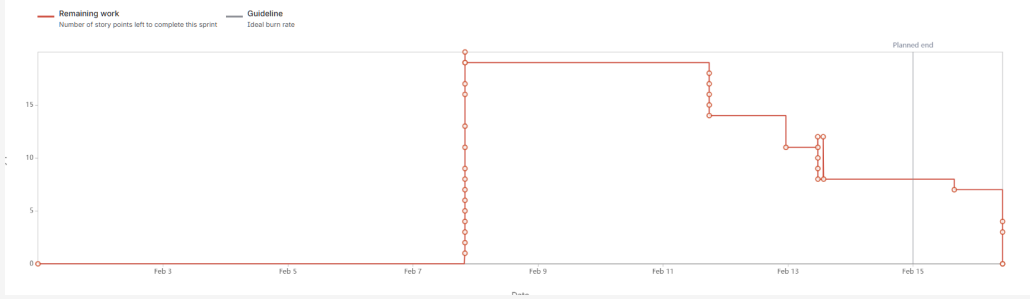


Burndown Chart – Sprint 1



Burndown chart Analysis





Sprint 2 progression is more consistent than Sprint 1. This can be seen from the progression lines on Sprint 2 that is closer to the linear pattern shown in dark gray. Compared to Sprint 1, Sprint 2 progressed at a steadier pace, while Sprint 1 showed slower progress in the first half and faster completion in the second half.

There is also evidence of increase in story points in the middle of sprint.

- For Sprint 2, this is because we forgot to put story points on one of the user stories for Sprint 2.
- For Sprint 1, this is because we just found out that we can put Story points on Jira in the middle of sprint. Therefore, you can see a sudden increase in story points on Feb 8.

Sprint velocity vs. previous sprint

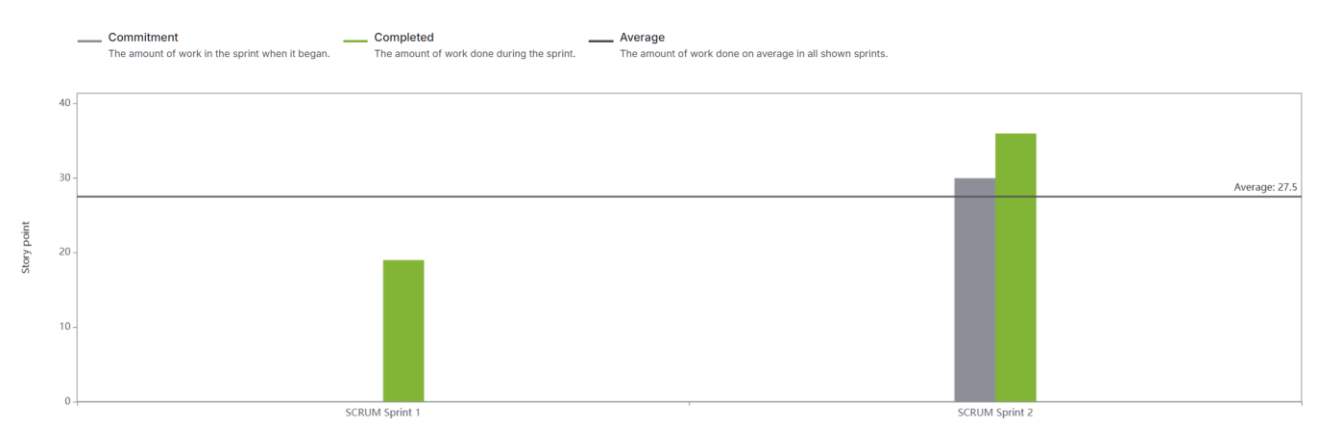


Figure 1: JIRA-exported Velocity Chart

The JIRA-exported chart suggests that Sprint 1 had no committed work and that Sprint 2 delivered more work than was originally committed.

However, this is misleading because story points were not assigned to the Sprint 1 user stories, and one feature completed in Sprint 2 was also missing story points at the start of the sprint. And therefore, the exported chart does not reflect the team's actual sprint commitment and delivery.

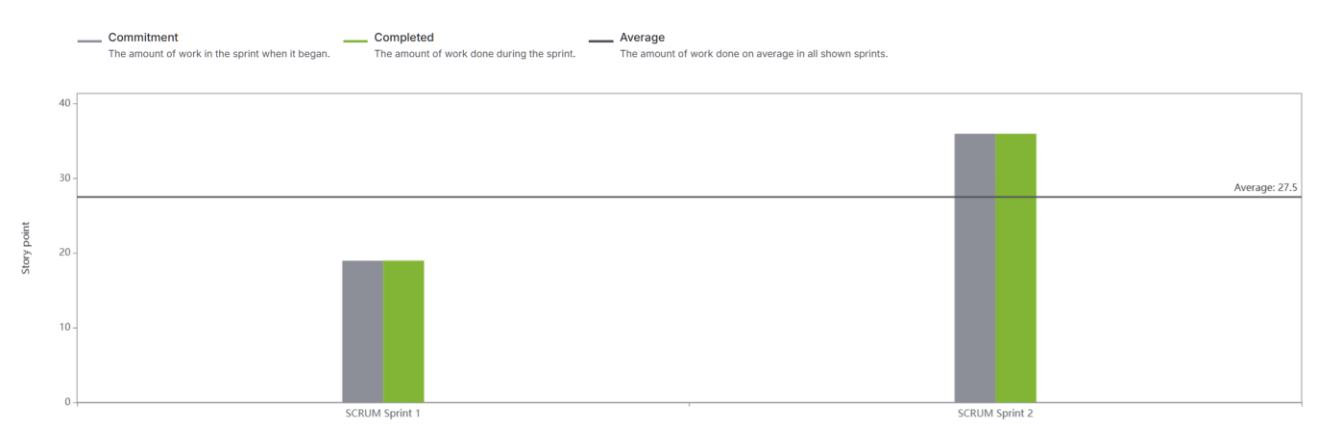

Figure 2: The TRUE velocity Chart

We then edited the chart to reflect the correct velocity by accounting for the missing story points. As can be seen on the chart, in both Sprint 1 and Sprint 2, we managed to complete all committed user stories, as indicated by the equal heights of the commitment and completed bars (gray bar height = green bar height).

This shows reliable sprint planning and successful delivery of planned features. The chart also shows an increase in completed story points from Sprint 1 to Sprint 2, which may suggest **improved team work** or greater confidence in taking on more work during the second sprint.

Changes and Why?

Story Points Adjustment

- As you may notice in burndown chart for both Sprint 1 and Sprint 2, at some point of time, there's an increase of story points which indicate an increase in total points (for stories that weren't done at that time).

- We modified some story points because we overestimated some points and underestimated some other points and realized of those over/under estimation in the middle of sprint while implementing the feature. Therefore, we modify the story points so that it shows the correct difficulty of each feature relative to other features. This allow us to accurately keep track of each member contributions.
